# **ASSIGNMENT - PYTHON**

Name: Fiyanshu Singh

Class: MCA 'A'

Repository Link: https://github.com/FiyanshuSingh3/Assignment1

# **Exercise 1: Arithmetic Operators**

- **Objective**: Write a Python program to perform the following operations:
  - 1. Add, subtract, multiply, and divide two numbers (input by the user).
  - 2. Use the modulus operator to find the remainder of their division.
  - 3. Use the exponentiation operator to raise the first number to the power of the second n umber.
  - 4. Perform floor division on the two numbers.
- **Approach**: The program will use input() to get two numbers from the user, then perform and display the results of each operation.
- **Key Learnings**: Understanding Python's arithmetic operators, the importance of type convers ion using float(), and gaining familiarity with various arithmetic operations in Python.

## **Exercise 2: Comparison Operators**

- Objective: Write a Python program that asks for two numbers and checks:
  - 1. If the first number is greater than the second.
  - 2. If the first number is equal to the second.
  - 3. If the first number is less than or equal to the second.
- **Approach**: The program will use input() to get two numbers from the user, then use if, elif, a nd else statements to compare the numbers and display the results.
- **Key Learnings**: Gained insight into using comparison operators and conditional statements to control program flow based on logical conditions.

# **Exercise 3: Boolean Logic**

- **Objective**: Write a Python program that:
  - 1. Takes three boolean values (True or False) as input.
  - 2. Uses and, or, and not operators to return the result of combining them.
- **Approach**: The program will use input() to take three boolean values, then apply and, or, and not operators to these values and display the results.
- **Key Learnings**: Learned to manipulate boolean values using logical operators, enabling contr of of program flow and decision-making.

# **Exercise 4: String Manipulation**

- **Objective**: Write a Python program that:
  - 1. Takes a string input from the user.
  - 2. Displays the following:
    - o The length of the string.
    - The first and last character.
    - o The string in reverse order.
    - o The string in uppercase and lowercase.
- **Approach**: The program will use input() to take a string from the user, then apply various string methods and indexing to extract and display the required information.
- **Key Learnings**: Gained practical knowledge of string methods, indexing, and slicing in Pyth on for effective string manipulation.

## **Exercise 5: String Formatting**

- **Objective**: Write a program that asks for the user's name and age, and displays the message in this format: Hello [Name], you are [Age] years old.
- **Approach**: The program will use input() to get the user's name and age, then use an f-string to format and display the message.
- **Key Learnings**: Gained practical knowledge of using f-strings for convenient and readable string formatting in Python.

# **Exercise 6: Substring Search**

- **Objective**: Write a Python program that:
  - 1. Asks for a sentence input from the user.
  - 2. Asks for a word to search in the sentence.
  - 3. Outputs whether the word exists in the sentence and, if it does, at which position (ind ex).
- **Approach**: The program will use input() to get a sentence and a word from the user, then che ck if the word is in the sentence and display the position if it exists.
- **Key Learnings**: Developed skills in string manipulation, searching for substrings, and using s tring methods to find the index of a word.

# **Exercise 7: List Operations**

- **Objective**: Write a Python program that:
  - 1. Creates a list of 5 numbers (input from the user).
  - 2. Displays the sum of all the numbers in the list.
  - 3. Finds the largest and smallest number in the list.
- **Approach**: The program will use input() to get five numbers from the user, store them in a list, then calculate and display the sum, largest, and smallest numbers in the list.
- **Key Learnings**: Developed skills in list creation and manipulation, as well as using list metho ds to perform common operations like finding the sum, maximum, and minimum values.

## **Exercise 8: List Manipulation**

- **Objective**: Write a Python program that:
  - 1. Creates a list of 5 of your favorite fruits.
  - 2. Performs the following:
    - o Adds one more fruit to the list.
    - o Removes the second fruit from the list.
    - o Prints the updated list.
- **Approach**: The program will start by creating a list of favorite fruits, then use list methods to add a new fruit and remove the second one, finally printing the updated list.
- **Key Learnings**: Gained practical knowledge of list operations such as adding and removing e lements, and updating the list.

## **Exercise 9: Sorting a List**

- **Objective**: Write a Python program that:
  - 1. Asks the user to input a list of 5 numbers.
  - 2. Sorts the list in ascending order and displays it.
  - 3. Sorts the list in descending order and displays it.
- **Approach**: The program will use input() to get five numbers from the user, store them in a lis t, then sort and display the list in both ascending and descending order.
- **Key Learnings**: Developed skills in list manipulation, sorting, and displaying lists in differen t orders using built-in methods.

#### **Exercise 10: List Slicing**

- **Objective**: Given the list numbers = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10], perform the following:
  - 1. Print the first 5 elements.
  - 2. Print the last 5 elements.
  - 3. Print the elements from index 2 to index 7.
- Approach: The program will use list slicing to extract and display the specified elements.
- **Key Learnings**: Gained practical knowledge of list slicing techniques to access specific parts of a list.

## **Exercise 11: Nested List**

- **Objective**: Write a Python program that:
  - 1. Takes input of 3 students' names and their respective scores in 3 subjects.
  - 2. Stores them in a nested list.
  - 3. Prints each student's name and their average score.
- **Approach**: The program will use input() to get the names and scores, store this information in a nested list, and then calculate and display each student's average score.
- **Key Learnings**: Gained practical knowledge of handling nested lists and performing calculati ons on data stored within them.
